## Solving a Mounting Pad Problem

I have been slowly putting my C-10 together. I was missing the rear crossmember which supports the transmission. I was able to find a crossmember, but needed the rubber mount. I made a cardboard template and went to my local *NAPA* store. We checked the parts book with all the nice pictures of motor mounts. None matched the template, but instead we found that two rectangular separate mounts with offset bolts would appear to do the job. They are now installed under the car. I had to enlarge the mounting holes to 1/2-inch and everything fit fine. The *NAPA* part number is 602-1170 for a 70s MoPar application. I got the 1/2-inch nuts and washers at the local home center. The best news is that the mounts only cost \$5.19 each.
